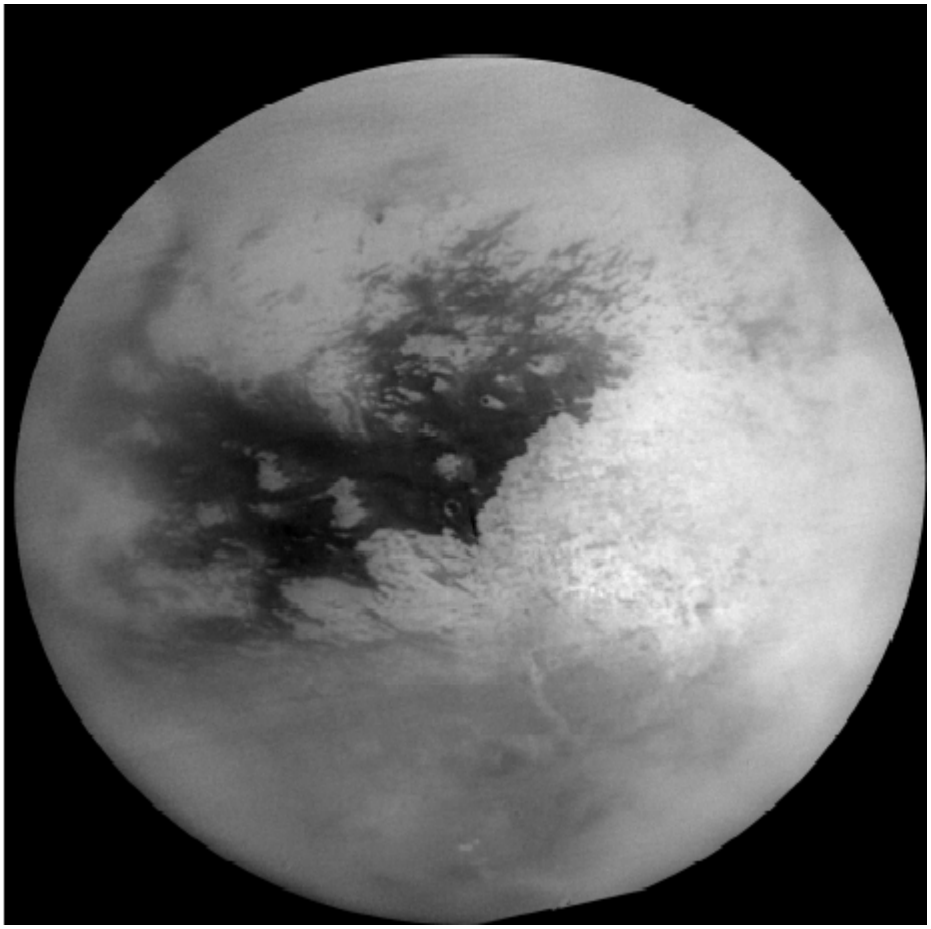
C A S S I N I



T I T A N 017TI(T8) MISSION DESCRIPTION

October 2005

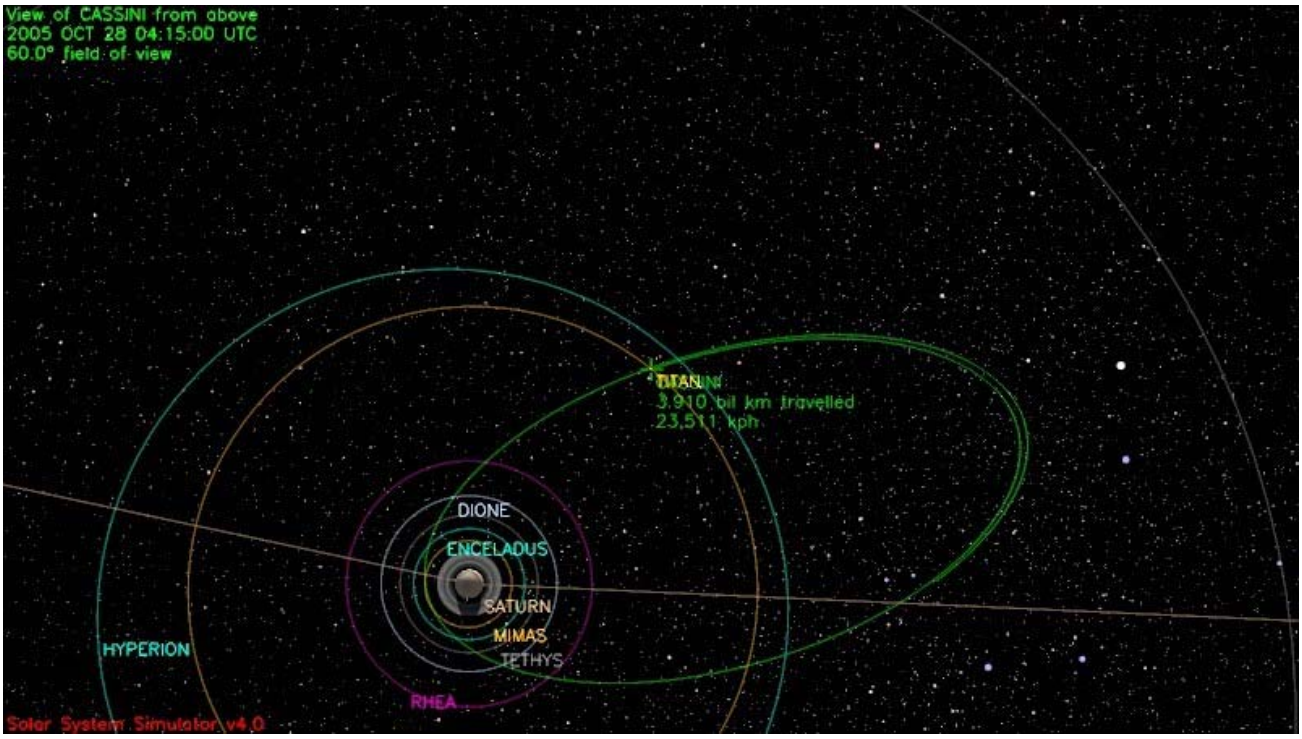
Jet Propulsion Laboratory
California Institute of Technology

1.0 OVERVIEW

After three amazing closest-ever encounters with the icy moons Tethys, Hyperion, and Dione, the spacecraft is returning to its 9th targeted encounter with the large atmosphere-enshrouded moon Titan.

The closest approach to Titan occurs on Friday, October 28th, at 04:15 spacecraft time (Thursday October 27th,10:31 PM Pacific Time) at an altitude of 1353 km (841 miles) above the surface and at a speed of 5.9 kilometers per second (13,200 mph). The latitude at closest approach is 1° and the encounter occurs on orbit number 17.

This encounter is set up with two maneuvers: an apoapsis maneuver scheduled for October 21st, and an approach maneuver, scheduled for October 25th. This inbound encounter occurs about 2 days before Saturn closest approach.



1.1 ABOUT TITAN

Titan is one of the primary scientific interests of the Cassini-Huygens mission. Through observations by Earth based telescopes and the Voyager spacecraft, Titan has been revealed to be an intriguing world both similar in nature to Earth and unique among both satellites and terrestrial planets. The largest of Saturn's satellites, Titan is larger than the planets Mercury or Pluto. Titan is the only satellite in the solar system with an appreciable atmosphere. Like Earth's atmosphere, Titan's atmosphere is composed mostly of Nitrogen, yet appears to have few clouds. However, it also contains significant quantities of aerosols and organic compounds (hydrocarbons), including methane and ethane. Although Titan's thick smoggy atmosphere masks its surface, scientists have speculated Titan's surface could contain solid, liquid and muddy material creating features such as lakes, seas, or rivers. Additionally liquid reservoirs may exist beneath the surface forming geysers or volcanoes that feed flowing liquid onto the surface.

Titan's peak surface temperature is about 95 Kelvin, too cold for liquid water, and due to its thick atmosphere, the pressure at the surface is 1.6 times greater than Earth's atmosphere. At this temperature and pressure, chemicals such as methane, ethane, propane, ammonia, water-ice and acetylene may be involved in complex interior-surface-atmosphere chemical cycles resulting in eruptions, condensation and precipitation (or rain). Initial observations obtained by Cassini during the first several passes of Titan provided our first close up views of Titan in wavelengths ranging from visible light to infrared to radar. The Huygens probe successfully returned atmospheric data and images of the surface, providing ground truth for the Cassini Orbiter measurements. The results show a mysterious world even more complex than previously thought. The diversity of surface composition and its connection to Titan's geologic features remains a fundamental question. Huygens' results indicate that methane exits as a liquid just below the surface and may rain from the atmosphere periodically. Clouds in Titan's atmosphere were observed in the southern hemisphere, yet no clear explanation has emerged on what the clouds are composed of, or why more clouds do not exist. Observations of Titan's interaction with Saturn's magnetosphere indicate the presence of complex processes complicated by Titan's occasional emergence out of Saturn's magnetosphere into the solar wind.

1.2 TITAN-6 SCIENCE ACTIVITIES

- RADAR will perform SAR imaging of the dark terrain west of Xanadu. This area includes the Huygens landing site.
- The Ion and Neutral Mass Spectrometer (INMS) will obtain data regarding atmospheric and ionospheric composition and thermal structure.
- The Magnetospheric and Plasma Science (MAPS) teams, in general, will continue observations of Titan's interaction with Saturn's magnetosphere – including the period within one hour of Titan closest approach.

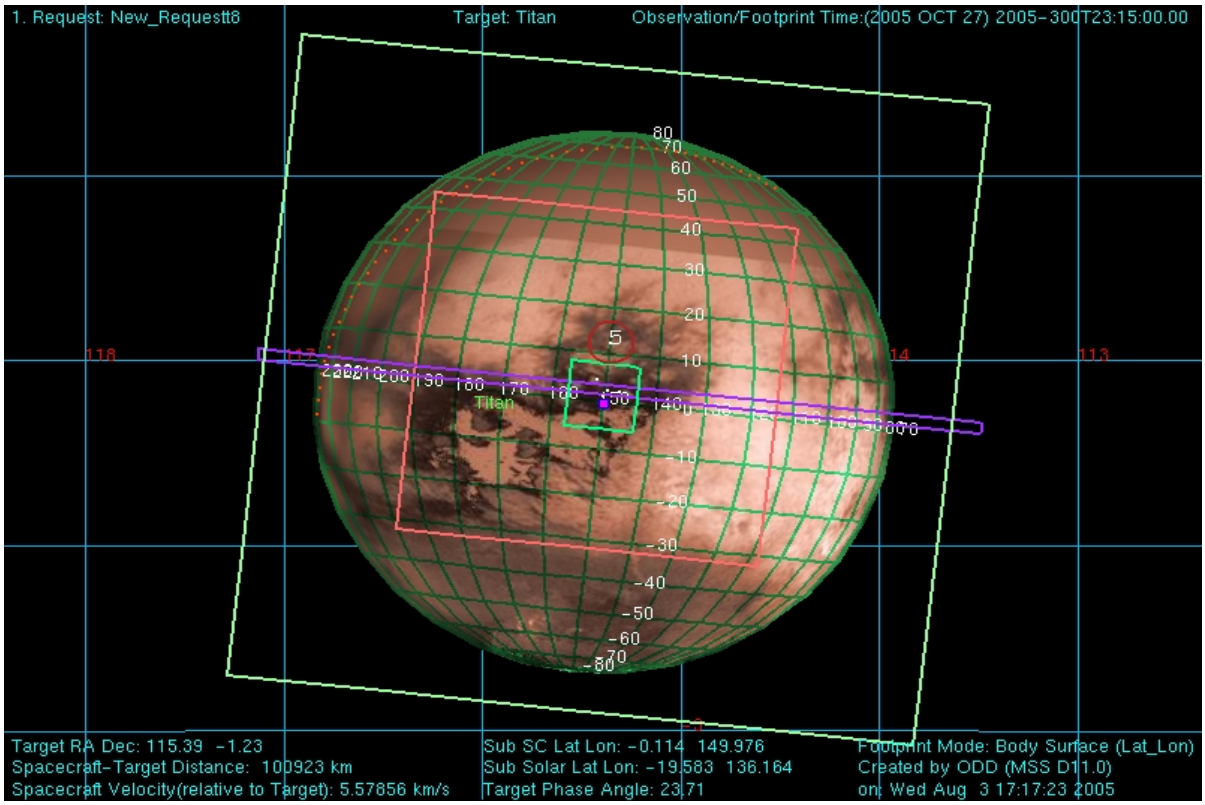
- The Radio and Plasma Wave Spectrometer (RPWS) will look for lightning and other radio emissions, perform a characterization of the plasma wave spectrum, and search for evidence of pickup ions.
- The Composite Infrared Spectrometer (CIRS) will obtain vertical profiles of temperatures, HCN, and C2H2 in Titan's tropopause, stratosphere, and on the surface. CIRS will also obtain information on trace constituents in the stratosphere.
- The Imaging Science Subsystem (ISS) will monitor Titan for surface and atmospheric changes, including cloud motion. Some high-resolution imaging also will occur.
- This is the first close encounter that is upstream of the wake Titan creates in the magnetospheric plasma. There is deep penetration into this magnetic "pile-up" region. The Magnetometer (MAG) team considers this to be "Grade 1" priority.

1.3 SAMPLE SNAPSHOTS

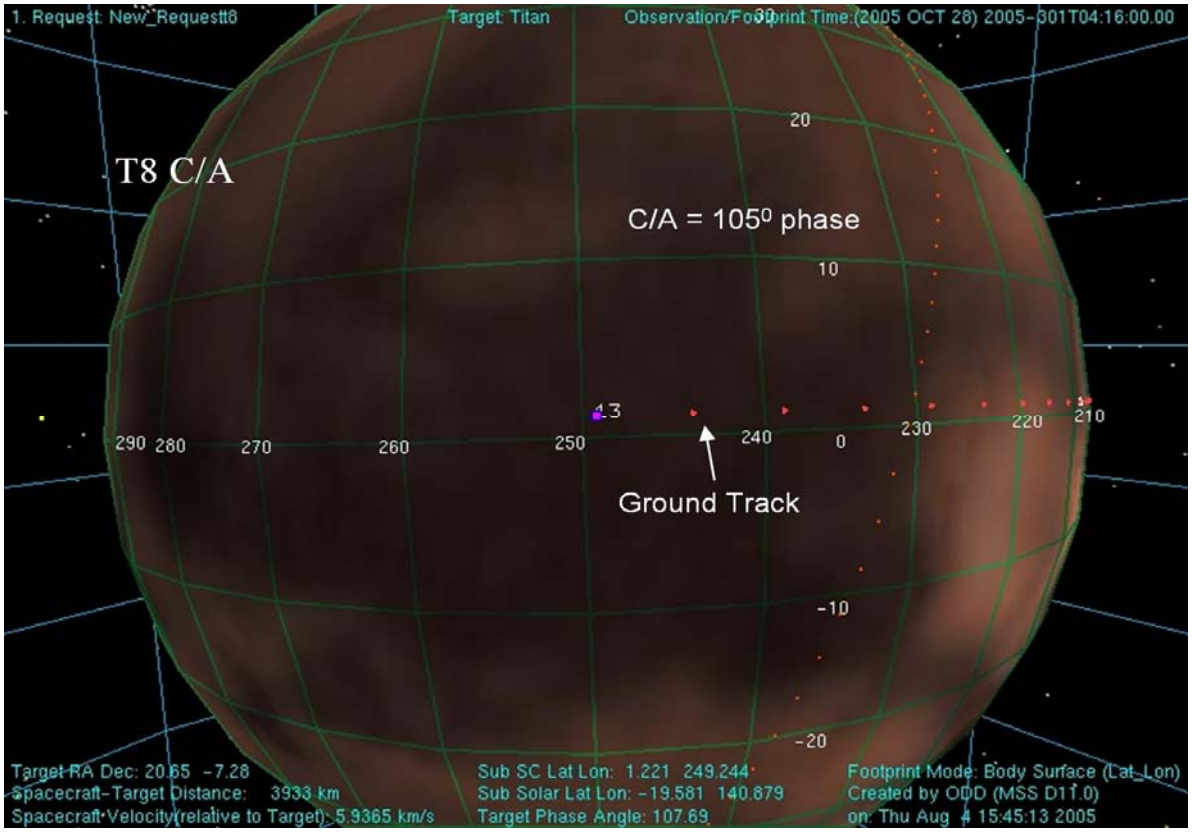
Three views of Titan from Cassini before, during, and after closest approach to Titan are shown below. The views are oriented such that the direction towards the top of the page is aligned with the Titan North Pole. Sample remote sensing instrument fields of view are drawn assuming that Cassini is pointed towards the center of Titan. The size of these fields of view vary as a function of the distance between Cassini and Titan. A key for use in identifying these instruments fields of view in the figures is listed below.

Key to Instrument Fields of View in Figures

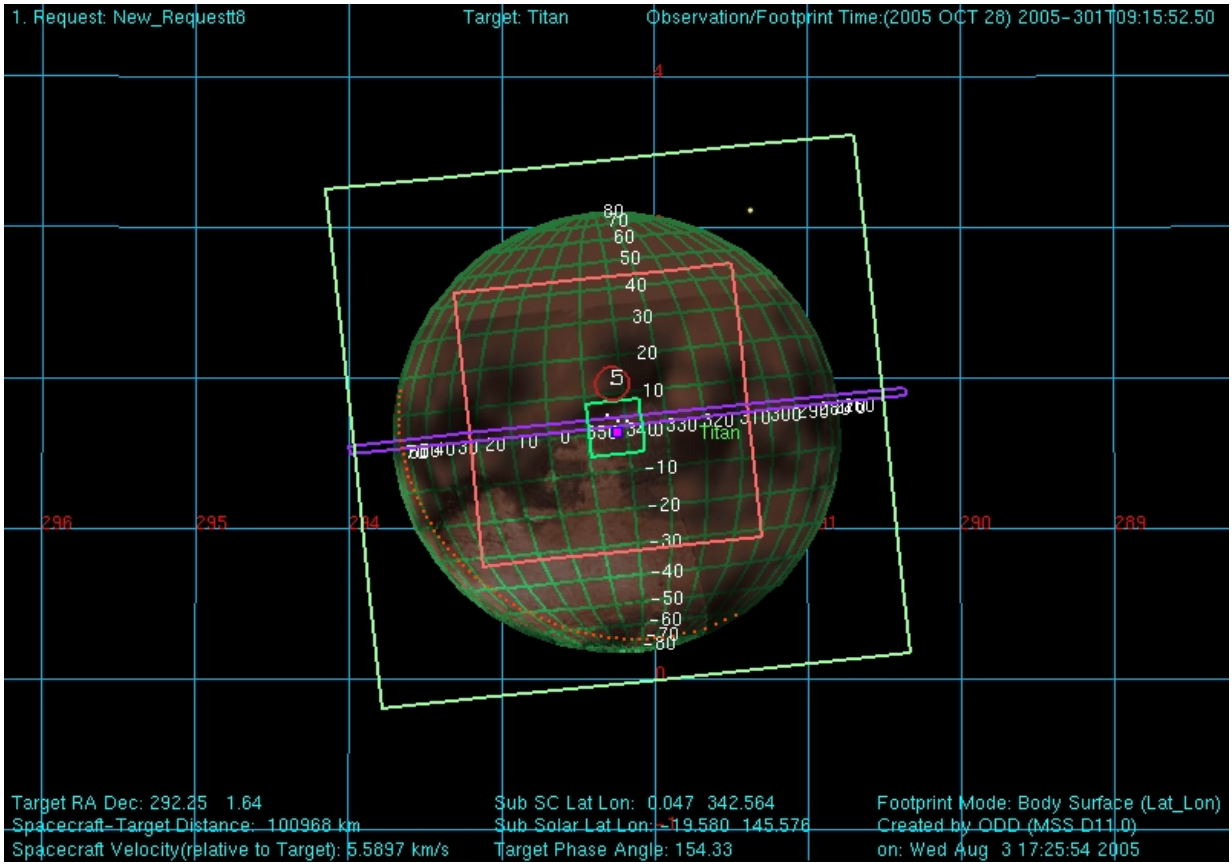
Instrument Field of View	Depiction in Figure
ISS WAC (imaging wide angle camera)	Largest square
VIMS (visual and infrared mapping spectrometer)	Next smallest pink square
ISS NAC (imaging narrow angle camera)	Smallest green square
CIRS (composite infrared spectrometer) – Focal Plane 1	Small red circle near ISS_NAC FOV
UVIS (ultraviolet imaging spectrometer)	Vertical purple rectangle centered within largest square



View of Titan from Cassini 5 hours Before Closest Approach (above)



View of Titan from Cassini at Closest Approach (above)



View of Titan from Cassini 5 hours After Closest Approach

Timeline and Geomegtry Table below

Cassini Titan-8 Timeline - October 2005

Colors: yellow = maneuvers; blue = geometry;
pink = T8-related; green = data playbacks

Orbiter UTC	Ground UTC	Pacific Time	Time wrt T8	Activity	Description
281T12:30:00	Oct 08 12:30	Sat Oct 08 05:30 AM	T8+37171d06h	Start of Sequence S15	Start of Sequence which contains Titan-8.
